

# FDU

UNDERFLOOR FAN POWERED BOOSTER & TERMINAL UNIT

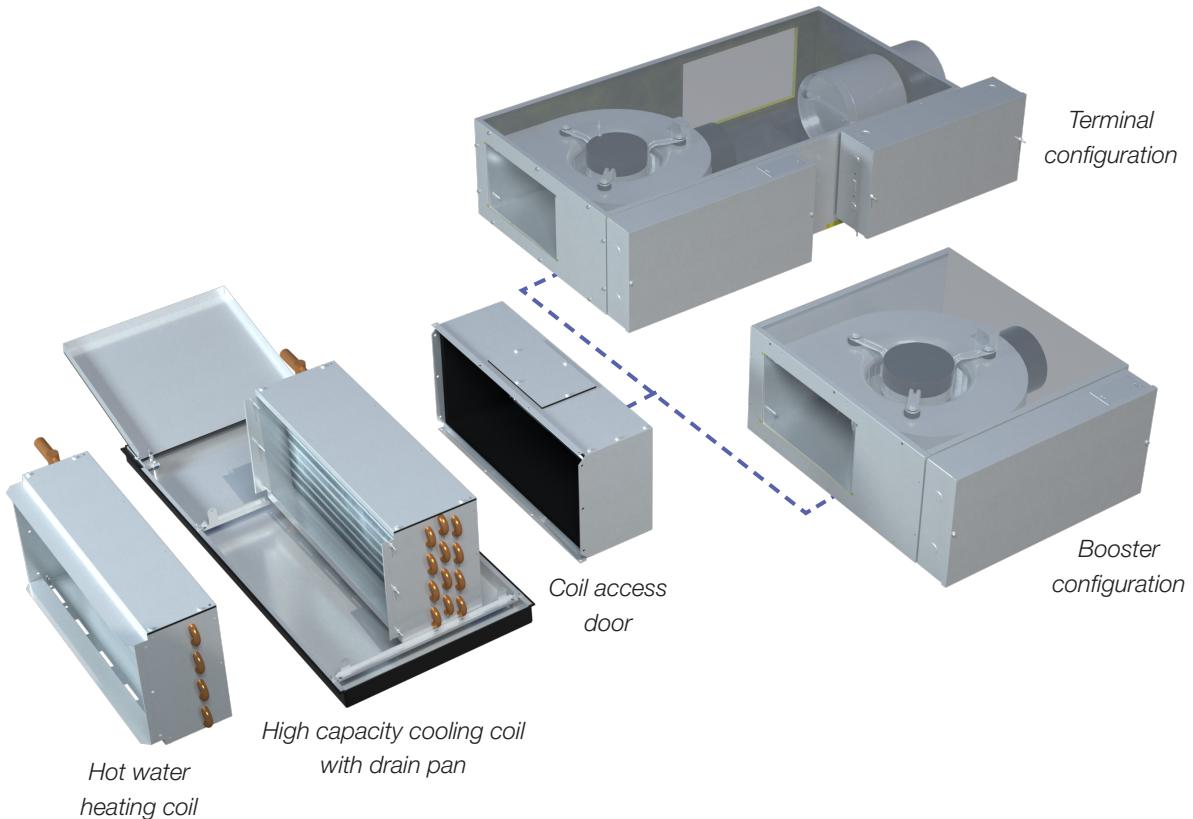

**PRICE** | UNDERFLOOR

# **FDU**

## **Underfloor Fan Powered Booster & Terminal Unit**

The Underfloor Terminal Unit (FDU) is available in various sizes and configurations in order to meet any application need. In cooling mode, plenum air is pulled through the fan and delivered to the perimeter to meet envelope loads. In heating mode, hot water or electric reheat coils can be used to warm the air up to meet heating demand.

In interior spaces the fan terminal can be ducted to supply grilles or used to pressurize a small sub-plenum. The fan terminal will ramp up and down to meet the space cooling requirement.

**FDU exploded view**

## COMPACT DESIGN

- + Units as low as 7.5 in. tall to fit within short plenum heights.
- + FDU and accessories are designed to fit within standard 2 ft. x 2 ft. floor pedestal grid.

## CAPACITY RANGE

- + 115 to 2400 CFM airflow range to meet the demands of a wide range of applications.
- + Five different unit sizes and two different configurations available to select from.

## PRICE CONTROLS

- + Native BACnet DDC controller comes factory mounted and pre-programmed, for a quick and easy installation.
- + Equipped with two plug-and-play RJ-12 connections for controlling up to 12 VAV cooling units.

## SUPERIOR ACOUSTICAL PERFORMANCE

- + Equipped with ECM motors as standard for quiet, energy efficient operation.
- + Acoustic lining and attenuators can be provided to meet the most stringent noise requirements.

## ECM PROGRAM OPTIONS

The FDU provides added flexibility by allowing the user to select an ECM program to best suit the application.

- + **High Turndown Flow** – This program enables lower minimum fan speeds and in most cases gives a 10:1 turndown ratio.
- + **Pressure Independent Flow** – This program ensures that the motor maintains the fan flow within 5% of the flow setpoint across varying static pressures.

## TYPICAL APPLICATIONS

The FDU is a low profile fan terminal designed specifically for underfloor applications. This unit provides forced air to a space, independent of plenum static pressure. The FDU is well suited for perimeter zones and spaces with rapid changes in demand such as large conference rooms and training rooms.

In perimeter applications the fan terminal is ducted to floor grilles.

## STANDARD DESIGN

- + Top access panel
- + 20 gauge casing
- + Solid state speed controller for adjusting airflow
- + 1/2 in. fiberglass insulation

## OPTIONAL FEATURES

- + Electric or water coils
  - 1-3 stage and SCR electric heat
  - 2-pipe, 4-pipe, or HCCO water coils
- + Multi-circuit cooling coils with up to 6 rows available
- + Galvanized or stainless steel drain pans
- + 1 in. thick throw away filter
- + 1/2 in. fiber free liner
- + Inlet damper
- + Deluxe ECM speed controller with digital RPM readout and feedback

# VERSATILE BOX CONFIGURATIONS

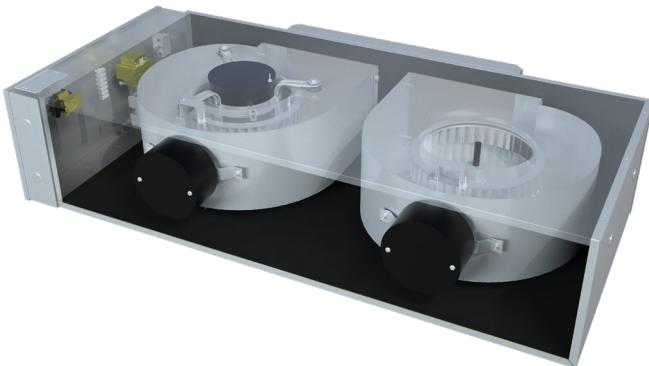

## Booster Configuration

The booster configuration is designed to provide forced air to the space from the plenum.

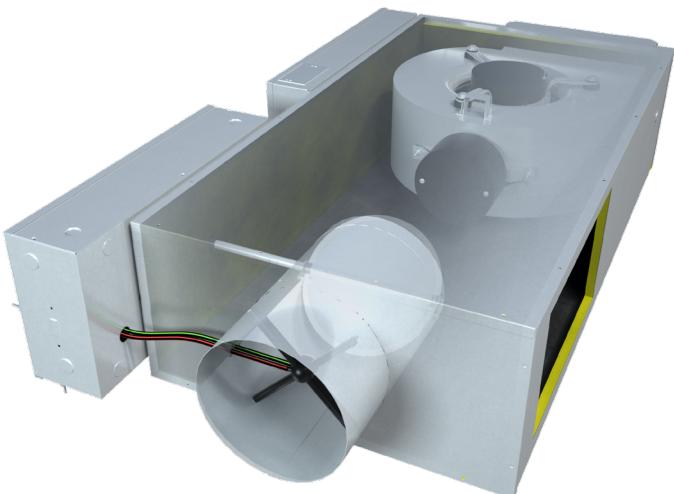

- + The underfloor fan terminal allows for controlling the air delivery to a space independent of static pressure within the common plenum.
- + The fan terminal can come equipped with a heating or cooling coil to efficiently warm or cool the supply air for an individual space.

*Booster configuration inlet*

*Dual blower configuration*

## Terminal Configuration

This mixing box configuration is designed to provide forced air to the space using both primary and return air inlets.

- + The primary inlet is supplied with an SP300 airflow sensor and damper which can be open to the plenum, or ducted directly to the fresh air supply.
- + The return inlet pulls air from the room, which can sometimes be drawn from high level, taking advantage of stratification.
- + This configuration can be fitted with a cooling coil to bring the mixed air stream to the desired temperature.

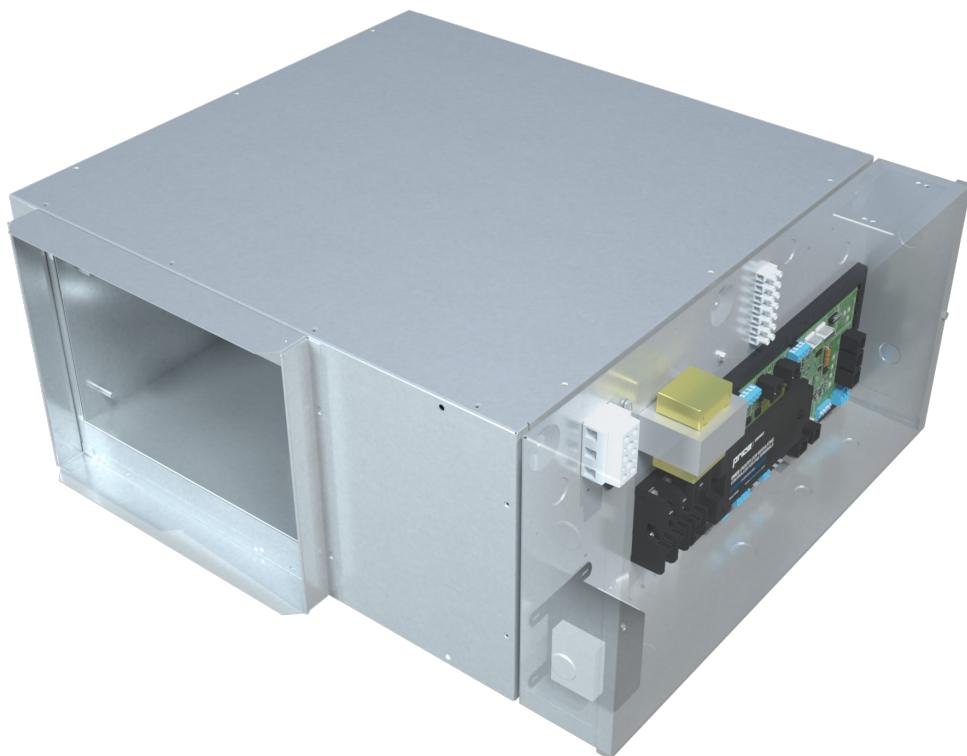

## PRICE ZONE CONTROLLER

The UMCB is used to control up to 12 remote terminal dampers. By supplying the UMCB complete with a Price thermostat, the UMCB will control the fan operation, as well as electric heat based on the thermostat's signal. The UMCB is a native BACNet controller, and can be controlled by a building automation system (BAS) instead of a thermostat using simple to connect RJ-45 BACNet ports. The UMCB comes mounted to terminal unit as standard, powered by an integral transformer.

The Price underfloor controllers integrate seamlessly with all Price underfloor devices, including the variable volume baskets, modulating linear floor grilles and linear floor heaters. All controllers are factory programmed for simple installation and commissioning. All Price remote terminal devices are connected to the controllers using simple RJ12 / RJ45 connectors with provided 25 ft. or 35 ft. cables, simplifying installation.

### Features

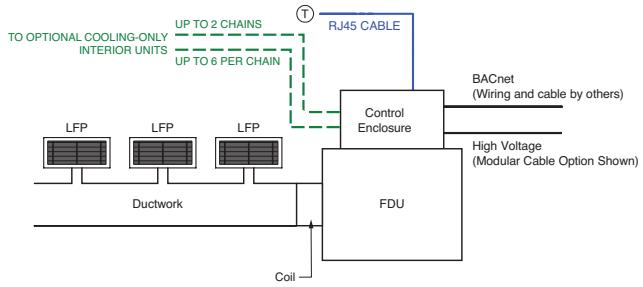

- + 19 terminal block connections capable of output signals such as cooling and heating control, ECM fan motor control, fan relay, reheat (binary, analog, and tristate), etc.
- + Two thermistor and 1 sensor connections that can be used for humidity or pressure sensing
- + Two RJ12 output jacks to convey power and control signal to 12 remote terminals
- + Two RJ45 jacks for network connection
- + Six thermostat options: Room Sensor, Dial, LCD, LCD with Motion Sensor, LCD with CO<sub>2</sub> and Humidity Monitoring, and Wireless Dial

## TYPICAL ZONE LAYOUTS

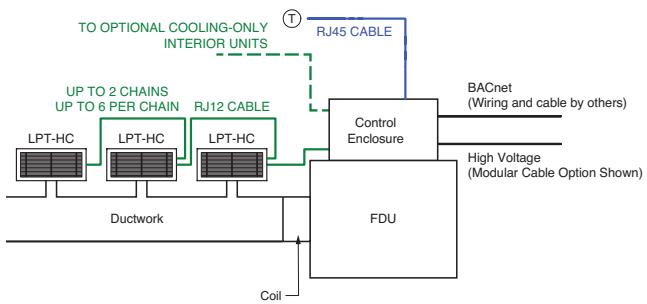

### Perimeter Zone – Ducted Heating and Cooling

In perimeter applications, an FDU can be used to provide fan-forced air through perimeter grilles using the Linear Floor Plenum (LFP). In cooling, plenum air is forced through the perimeter grilles via the FDU. In heating, the heating coil is energized and plenum air is heated up, supplying warm air to the perimeter. The on-board zone controller can modulate fan airflow to meet the set point for the space, as well as controlling an electric heater or hot water valves.

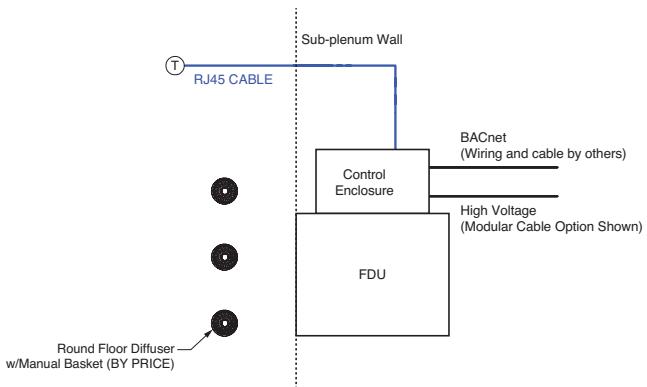

### Perimeter Zone – Ducted Heating and Plenum Cooling

The FDU can also be combined with the Linear Plenum Terminal (LPT). In this zone type, a modulating damper on the LPT controls the flow of cool plenum air into the space without using the fan terminal. When heating is required, this damper closes and ducted hot air is forced by the fan terminal to the perimeter grilles. The on-board zone controller can modulate fan airflow to meet the set point for the space, as well as controlling the modulating VAV dampers in the LPT during cooling. In addition, nearby cooling-only round floor DBV baskets can be controlled by the on-board zone controller.

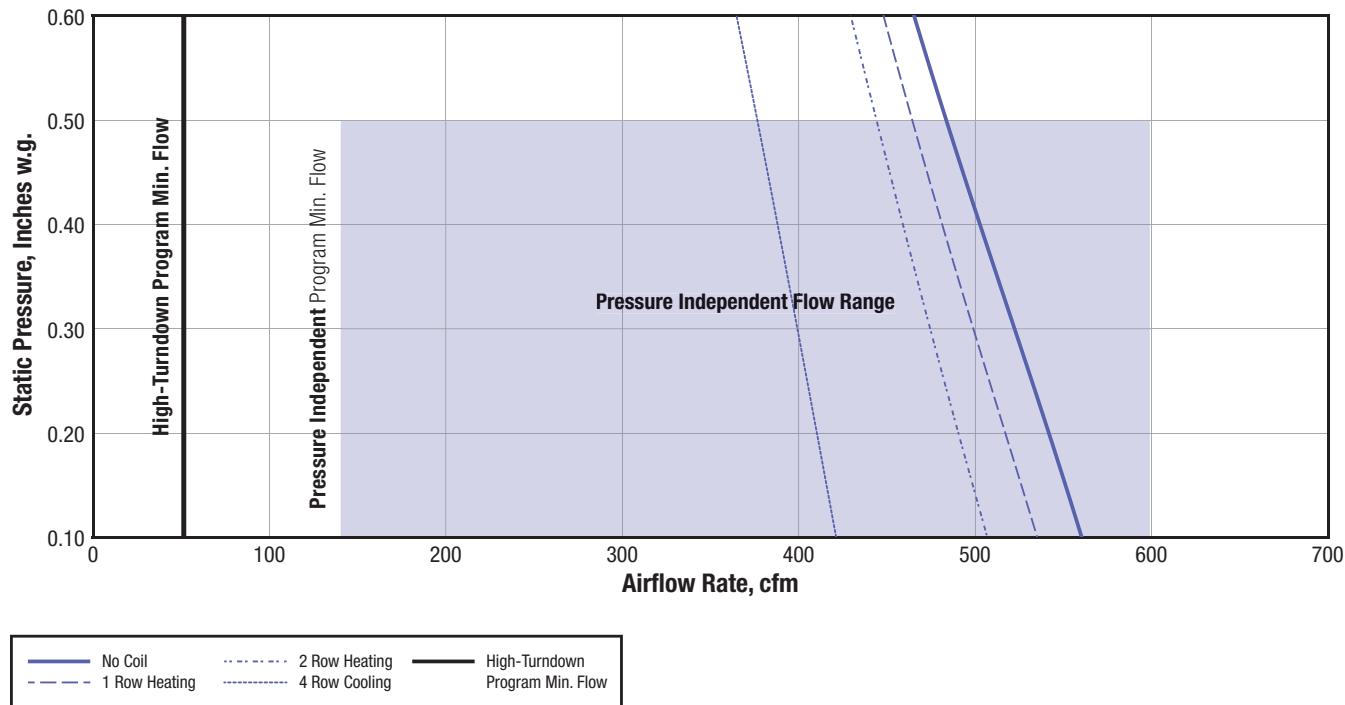

### Special Zone

An FDU can also be used for interior rooms where cooling demand may vary. By constructing a sub-plenum under a conference room and pressurizing that space with an FDU, the conference room can be completely isolated from the conditions of the larger pressurized plenum. This allows the fan terminal to ramp up the pressure in the sub plenum beyond that of the shared, larger plenum, to handle sharp increases in demand.

#### Performance Notes:

1. Maximum primary airflow is limited by maximum fan airflow.
2. Minimum fan airflow is with High Turndown Flow (HTF) motor program.
3. Maximum fan airflow values is with base assembly (no coil, no filter) and downstream static pressure of 0.1 in. w.g.
4. EC max kW shown is for 1 stage. Up to 3 stage EC is also available.
5. DP means that voltage only offered with dual point power.

#### Performance Notes:

1. Test data obtained in accordance with AHRI Standard 880-2011 and ASHRAE Standard 130-2016.
2. Sound Power Levels expressed in decibels (dB) re 10<sup>-12</sup> watts
3. Data is raw without any corrections for Room Absorption, duct attenuation, or ceiling transmission loss.
4. Fan external static pressure is 0.25" W.G. in all cases.

#### ARI Certification Notes:

1. Primary CFM is the standard rated air volume for the inlet.
2. Fan CFM is the maximum rated fan volume at 0.25" w.g. downstream static pressure.
3. Input watts is the maximum electrical power input at the maximum rated fan volume.
4. Minimum operating pressure inlet is the minimum operating pressure requirement of the primary air valve at the rated primary CFM.
5. Fan only sound power levels are at the maximum rated fan volume.
6. Power levels at the maximum rated fan volume and rated primary CFM at 1.5" w.g. inlet static.

| 80       | 0.48     | 0.57 | 0.65 | 0.70 | 0.83 | 0.92 | 1.00 | 1.08 | 1.17 |

### Performance Notes:

1. Tabulated values are in MBH (thousands of BTU/h) and using an arbitrary circuit option. Other circuit options are available.
2. Tables are based on 180°F EWT & 70°F EAT for heating, and 80°F DB / 67°F WB EAT & 45°F EWT for cooling.
3. Multiply MBH values by correction factors listed for other temperature difference conditions.
4. Minimum flows are based on ASHRAE recommendation for coil selection. For further selections please contact your local Price representative.
5. Water pressure drop (WPD) or head loss is in feet of water.
6. Air pressure drop (APD) is the pressure drop in inches of water across the coil.
7. See fan curves for fan capacity with coils.
8. Air temperature rise = ATR (°F) = 927 x MBH/CFM
9. Water temperature drop = WTD (°F) = 2.04 x MBH/GPM
10. Values in tables are listed for 0 ft. of altitude and no glycol in the system.
11. For information outside the ranges in these tables, consult the current Price software of your local Price representative for accurate information.
12. Connections: 7/8 in. OD male solder.
13. Coils used have been performance rated and certified in accordance with the current edition of AHRI Standard 410

**Performance Notes:**

1. Tabulated values are in MBH (thousands of BTU/h) and using an arbitrary circuit option. Other circuit options are available.
2. Tables are based on 180°F EWT & 70°F EAT for heating, and 80°F DB / 67°F WB EAT & 45°F EWT for cooling.
3. Multiply MBH values by correction factors listed for other temperature difference conditions.
4. Minimum flows are based on ASHRAE recommendation for coil selection. For further selections please contact your local Price representative.
5. Water pressure drop (WPD) or head loss is in feet of water.
6. Air pressure drop (APD) is the pressure drop in inches of water across the coil.
7. See fan curves for fan capacity with coils.
8. Air temperature rise = ATR (°F) = 927 x MBH/CFM
9. Water temperature drop = WTD (°F) = 2.04 x MBH/GPM
10. Values in tables are listed for 0 ft. of altitude and no glycol in the system.
11. For information outside the ranges in these tables, consult the current Price software or your local Price representative for accurate information.
12. Connections: 7/8 in. OD male solder.
13. Coils used have been performance rated and certified in accordance with the current edition of AHRI Standard 410

**Performance Notes:**

1. Tabulated values are in MBH (thousands of BTU/h) and using an arbitrary circuit option. Other circuit options are available.
2. Tables are based on 180°F EWT & 70°F EAT for heating, and 80°F DB / 67°F WB EAT & 45°F EWT for cooling.
3. Multiply MBH values by correction factors listed for other temperature difference conditions.
4. Minimum flows are based on ASHRAE recommendation for coil selection. For further selections please contact your local Price representative.
5. Water pressure drop (WPD) or head loss is in feet of water.
6. Air pressure drop (APD) is the pressure drop in inches of water across the coil.
7. See fan curves for fan capacity with coils.
8. Air temperature rise = ATR (°F) = 927 x MBH/CFM
9. Water temperature drop = WTD (°F) = 2.04 x MBH/GPM
10. Values in tables are listed for 0 ft. of altitude and no glycol in the system.
11. For information outside the ranges in these tables, consult the current Price software or your local Price representative for accurate information.
12. Connections: 7/8 in. OD male solder.
13. Coils used have been performance rated and certified in accordance with the current edition of AHRI Standard 410

Product Improvement is a continuing endeavour at Price. Therefore, specifications are subject to change without notice.
