

# Engineering E-Update

## Active Beam Options

---

*Price Active Beams now feature an Optional Controls Enclosure, an Integrated Diffuser and an Integrated Return.*

### Optional Controls Enclosure

Beam maintenance is revolutionized with the new face-accessible enclosure section (ABS12), now available in the ACBL. Unique to Price, this feature allows for easy access to controls and valves during maintenance and commissioning when beams are installed in hard ceilings or when access to the plenum is restricted.

Smooth integration into the beam ensures a seamless, aesthetically pleasing appearance from the room. Several beams can be run from a single controller and set of valves, so adding this specifiable option to a single beam can allow beams in the zone to be serviced without negatively impacting project costs.

### Integrated Return / Diffusers

The integrated diffuser allows for the selection of a beam with a high transfer efficiency to optimize the mechanical system while allowing for additional supply air to be injected into the zone. This is ideal for areas with high ventilation requirements, such as classrooms or laboratories. This diffuser section is available with a VAV inlet that provides the ability to turn down the air flow under part-load/occupancy conditions.

The integrated return allows the architect to hide the return grille in the face of the beam, eliminating a mechanical component in the ceiling.
